Clearance Sponsor Attribute

Abstract

This document defines the clearance sponsor attribute. It indicates
the entity that sponsored (i.e., granted) the clearance. This
attribute is intended for use in public key certificates and
attribute certificates that also include the clearance attribute.

Status of This Memo

This document is not an Internet Standards Track specification; it is
published for informational purposes.

This document is a product of the Internet Engineering Task Force
(IETF). It represents the consensus of the IETF community. It has
received public review and has been approved for publication by the
Internet Engineering Steering Group (IESG). Not all documents
approved by the IESG are a candidate for any level of Internet
Standard; see Section 2 of RFC 5741.

Information about the current status of this document, any
errata, and how to provide feedback on it may be obtained at

the Trust Legal Provisions and are provided without warranty as
described in the Simplified BSD License.
1. Introduction

This document specifies the clearance sponsor attribute. It is included in public key certificates [RFC5280] and attribute certificates [RFC5755]. This attribute is only meaningful as a companion of the clearance attribute [RFC5755] [RFC5912]. The clearance sponsor is the entity (e.g., agency, department, or organization) that granted the clearance to the subject named in the certificate. For example, the clearance sponsor for a subject asserting the Amoco clearance values [RFC3114] could be "Engineering".

This attribute may be used in automated authorization decisions. For example, a web server deciding whether to allow a user access could check that the clearance sponsor present in the user's certificate is on an "approved" list. This check is performed in addition to certification path validation [RFC5280]. The mechanism for managing the "approved" list is beyond the scope of this document.

NOTE: This document does not provide an equivalent Lightweight Directory Access Protocol (LDAP) schema specification as this attribute is initially targeted at public key certificates [RFC5280] and attribute certificates [RFC5755]. Definition of an equivalent LDAP schema is left to a future specification.

1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

1.2. ASN.1 Syntax Notation

The attribute is defined using ASN.1 [X.680], [X.681], [X.682], and [X.683].

2. Clearance Sponsor

The clearance sponsor attribute, which is only meaningful if the clearance attribute [RFC5755] [RFC5912] is also present, indicates the sponsor of the clearance of the subject with which this attribute is associated. The clearance sponsor attribute is a DirectoryString [RFC5280], which MUST use the UTF8String CHOICE, with a minimum size of 1 character and a maximum of 64 characters.
The following object identifier identifies the sponsor attribute:

```
id-clearanceSponsor OBJECT IDENTIFIER ::= {
    joint-iso-ccitt(2) country(16) us(840) organization(1) gov(101)
    dod(2) infosec(1) attributes(5) 68
}
```

The ASN.1 syntax for the clearance sponsor attribute is as follows:

```
at-clearanceSponsor ATTRIBUTE ::= {
    TYPE DirectoryString { ub-clearance-sponsor } (
        WITH COMPONENTS { utf8String PRESENT } )
    EQUALITY MATCHING RULE caseIgnoreMatch
    IDENTIFIED BY id-clearanceSponsor
}
```

```
ub-clearance-sponsor INTEGER ::= 64
```

There MUST only be one value of clearanceSponsor associated with a particular certificate. Distinct sponsors MUST be represented in separate certificates.

When an environment uses the Clearance Sponsor attribute, it is important that the same representation of the sponsor be used throughout the environment (e.g., using the same acronym). Further, the value in this attribute is not meant to be globally unique. When included in certificates, it is unique within the scope of the issuer.

3. Security Considerations

If this attribute is used as part of an authorization process, the procedures employed by the entity that assigns each clearance sponsor value must ensure that the correct value is applied. Including this attribute in a public key certificate or attribute certificate ensures that the value for the clearance sponsor is integrity protected.

The certificate issuer and clearance sponsor are not necessarily the same entity. If they are separate entities, then the mechanism used by the clearance sponsor to convey to the certificate issuer that the clearance sponsor did in fact grant the clearance to the subject needs to be protected from unauthorized modification.

If two entities are verifying each other’s certificates, they do not share the same issuer, and they use the same clearance sponsor value (e.g., a United Kingdom PKI includes "MoD" and a New Zealand PKI also includes "MoD"), then the relying party has two choices: 1) accept
the two strings as equivalent, or 2) indicate the sponsor as well as
the trust anchor. To solve this problem, a mechanism, which is
outside the scope of this specification, could be developed to allow
a relying party to group together issuers that share a same context
within which sponsor names have a unique significance.

While values of DirectoryString can include the NUL (U+0000) code
point, values used to represent clearance sponsors typically would
not. Implementations of the caseIgnoreMatch rule must, per X.501,
consider all of the assertion value and attribute value in matching
and hence protect against truncation attacks.
