## 1. Introduction

This document specifies how to use ML-DSA keys and signatures as described in [FIPS-204], in conjunction with JOSE and COSE. A new key type named Algorithm Key Pair (AKP) is defined to express public and private keys for use with algorithms not limited to those registered in this document. Similarly, a new thumbprint algorithm is defined for AKP, to ensure these keys can be compared according to the procedures defined in [RFC7638] and [RFC9679].

## 2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

Some examples in this specification are truncated using "..." for readability.

## 3. Algorithm Key Pair Type

This section specifies a generic cryptographic key structure for use with algorithms not limited to those registered in this document. The Algorithm Key Pair (AKP) Type is used to express Public and Private Keys for use with Algorithms. The concept of public and private information classes for key pairs originates from Section 8.1 of [RFC7517]. The parameters for public and private information classes contain byte strings in a format specified by the alg value. The alg JSON Web Key Parameter or COSE Key Common Parameter is REQUIRED for all AKP keys. The pub parameter contains public information and is REQUIRED. The priv parameter contains private information and MUST NOT be present in public keys. Some algorithms may require or recommend additional structure or length checks for associated key type parameters.

When AKP keys are expressed as JSON Web Keys (JWK), the key parameters are base64url encoded. When AKP keys are expressed as COSE keys, no encoding is needed.

This document introduces the AKP key type in [IANA.jose]:

An example truncated private key for use with ML-DSA-44 in JWK format is provided below:

  "priv": "AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA"
}
```

#### 4. ML-DSA Private Keys

Note that US NIST [FIPS-204] defines 2 expressions for private keys: a seed, and a private key that is expanded from the seed.

Unlike [I-D.draft-ietf-lamps-dilithium-certificates], which supports the expanded private key format to maximize interoperability with existing implementations, this document specifies ML-DSA private key information using only the seed format. The seed format was chosen to provide a single, compact representation that is consistent across both COSE and JOSE, simplifying key management and reducing storage requirements.

For the ML-DSA private keys described in this document, the `priv` parameter MUST be the seed, and MUST have a length of 32 bytes.

This specification intentionally does not define a means of utilizing the expanded private key representation defined by US NIST FIPS so as to increase interoperability by having a single ML-DSA private key representation for COSE and JOSE.

See Security Considerations of this document for details.

## 5. ML-DSA Algorithms

The ML-DSA Signature Scheme is parameterized to support different security levels.

In this document, the abbreviations ML-DSA-44, ML-DSA-65, and ML-DSA-87 are used to refer to ML-DSA with the parameter choices given in Table 1 of [FIPS-204].

This document has registered the ML-DSA-44, ML-DSA-65, and ML-DSA-87 algorithms in [IANA.jose] and [IANA.cose].

In accordance with Algorithm Key Pair Type section of this document, ML-DSA key parameters have the following additional constraints:

The pub parameter is the ML-DSA public key, as described in Section 5.3 of US NIST [FIPS-204].

The size of pub, and the associated signature for each of these algorithms is defined in Table 2 of US NIST [FIPS-204], and repeated here for convenience:

Algorithm	Private Key	Public Key	Signature Size
ML-DSA-44	2560	1312	2420
ML-DSA-65	4032	1952	3309
ML-DSA-87	4896	2592	4627

Table 1: Sizes (in bytes) of keys and signatures of  
ML-DSA

Note that priv size is always 32 bytes, and that KeyGen\_internal is called to produce the expanded private keys for "Private Key" in the table above.

See Section 4, ML-DSA Private Keys, for further details.

These algorithms are used to produce signatures as described in Algorithm 2 of US NIST [FIPS-204].

The ctx parameter MUST be the empty string for ML-DSA-44, ML-DSA-65 and ML-DSA-87.

Signatures are encoded as bytestrings using the algorithms defined in Section 7.2 of US NIST [FIPS-204].

When producing JSON Web Signatures, the signature bytestrings are base64url encoded, and the encoded signature size is larger than described in the table above. When producing COSE signatures, no encoding is needed; see Section 4 of [RFC9052] for more details on how COSE signatures are created.

Table 2 of [FIPS-204] describes the ML-DSA key and signature sizes. ML-DSA produces significantly larger public keys and signatures compared to traditional algorithms. This size increase can create challenges for deployments with limited bandwidth, memory, or processing capacity. ML-DSA may not be suitable for use cases requiring small keys or signatures. Use of thumbprints as described in [RFC7638] and [RFC9679] can reduce the need to repeat public key representations.

## 6. AKP Thumbprints

Although this document specifies how to represent ML-DSA keys using AKP, the AKP key type and thumbprint computations are suitable for use with algorithms other than ML-DSA.

When computing the COSE Key Thumbprint as described in [RFC9679], the required parameters for algorithm key pairs are:

- \* "kty" (label: 1, data type: int, value: 7)
- \* "alg" (label: 3, data type: int, value: int)
- \* "pub" (label: -1, value: bstr)

The COSE Key Thumbprint is produced according to the process described in Section 3 of [RFC9679].

When computing the JWK Thumbprint as described in [RFC7638], the required parameters for algorithm key pairs are:

- \* "kty"
- \* "alg"
- \* "pub"

Their lexicographic order, per Section 3.3 of [RFC7638], is:

- \* "alg"

- \* "kty"

- \* "pub"

The JWK Key Thumbprint is produced according to the process described in Section 3 of [RFC7638].

See the kid values in the JSON Web Key and COSE Key examples in the appendix for examples of AKP thumbprints.

## 7. Security Considerations

The security considerations of [RFC7515], [RFC7517], and [RFC9053] apply to this specification as well.

A detailed security analysis of ML-DSA is beyond the scope of this specification; see [FIPS-204] for additional details. Implementers should also refer to the security considerations in [I-D.draft-ietf-lamps-dilithium-certificates] for additional guidance on ML-DSA deployment considerations, including discussions on randomized versus deterministic signing approaches.

### 7.1. Private key compromise

The seed and the private key expanded from the seed require the same level of protection. If an unauthorized party obtains the seed, or the expanded private key, they can forge signatures. This undermines the authenticity and integrity guarantees provided by ML-DSA, as attackers could impersonate the legitimate signer or alter signed data without detection.

### 7.2. Rationale for not supporting HashML-DSA

This document does not specify algorithms for use with HashML-DSA as described in Section 5.4 of [FIPS-204]. As the verify routines are different, future support for HashML-DSA would require the registration of additional algorithms. Section 8.3 of [I-D.draft-ietf-lamps-dilithium-certificates] explains the rationale for disallowing HashML-DSA, including the increased complexity and compatibility concerns with existing implementations.

### 7.3. Validation of keys

When an AKP algorithm requires or encourages that a key be validated before being used, all algorithm-related key parameters MUST be validated.

Section 7.2 of [FIPS-204] describes the encoding of ML-DSA keys and signatures. For Algorithms 22 and 23 (pkEncode and pkDecode), the inputs need to be within the ranges given in the algorithms. For the ML-DSA algorithms registered in this document, the priv key parameter is the seed, and therefore, the seed length check MUST be performed. The length of the seed is 256 bits, which is 32 bytes. However, when the priv parameter is expanded using KeyGen\_internal, the skEncode and skDecode algorithms MUST be used. [FIPS-204] notes, "skDecode should only be run on inputs that come from trusted sources" and that "as the seed can be used to compute the private key, it is sensitive data and shall be treated with the same safeguards as a private key".

#### 7.4. Mismatched AKP parameters

When using an AKP key with an algorithm, it is possible that the public and private information class parameters have been tampered with or mismatched. Depending on the algorithm and implementation, the consequences of using mismatched parameters can range from operations failing to private key compromise.
