Conveying the More Instant Messaging Interoperability Message ID in
Messaging Layer Security Additional Authenticated Data
draft-mahy-mimi-msgid-aad-01

Abstract

The More Instant Messaging Interoperability (MIMI) content format defines a MIMI Message ID, communicated only to members of the Messaging Layer Security (MLS) group in which the message was sent. This document defines a way to share a Message ID in the MLS Additional Authenticated Data (AAD) so it is visible to MIMI providers.

About This Document

This note is to be removed before publishing as an RFC.

The latest revision of this draft can be found at <https://rohanmahy.github.io/mimi-msgid-aad/draft-mahy-mimi-msgid-aad.html>. Status information for this document may be found at <https://datatracker.ietf.org/doc/draft-mahy-mimi-msgid-aad/>.

Discussion of this document takes place on the More Instant Messaging Interoperability mailing list (<mailto:mimi@ietf.org>), which is archived at <https://mailarchive.ietf.org/arch/browse/mimi/>. Subscribe at <https://www.ietf.org/mailman/listinfo/mimi/>.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 19 April 2026.

1. Introduction

Many messaging protocols and formats have a Message ID. The MIMI content format defines how to calculate a MIMI Message ID (See Section 3.3 of [I-D.ietf-mimi-content]) for an application/mimi-content application message. A MIMI Message ID is currently only shared end-to-end encrypted with members of the MLS [RFC9420] group in which the message was sent. This document defines an optional mechanism to share a Message ID in the MLS AAD, so it is visible to intermediary providers. This greatly facilitates debugging and troubleshooting, but causes a modest reduction in privacy.

2. Conventions and Definitions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. Mechanism

This document defines a new Safe AAD `message_id` component as described in Section 4.9 of [I-D.ietf-mls-extensions].

When the content of an MLS application message is a MIMI content message (media type `application/mimi-content`), if the `message_id` component is present inside `SafeAAD.aad_items`, it MUST contain the MIMI content Message ID calculated as described in Section 3.3 of [I-D.ietf-mimi-content].

To the extent that other application formats or media types have a Message ID, the Message ID for an application message of that type or format MAY be conveyed in this extension, using a message ID appropriate to the media type of the content.

4. Security Considerations

An attacker or provider with access to a fragment of message history, and the message logs of a MIMI provider in the path of a message could potentially learn more about the participants of a particular MIMI room or the room's corresponding MLS group if it can see message IDs.

5. IANA Considerations

5.1. `message_id` MLS Component Type

This document registers a new MLS Component Type in the Specification Required range with the following template:

- * Value: TBD (new assignment by IANA)
- * Name: `message_id`
- * Where: AD
- * Recommended: Y
- * Reference: RFC XXXX
