Referring to NWG/RFC: 11, it appears that file transmissions over auxiliary connections will require some mechanism to specify "END-OF-FILE." It is proposed that a length 0 (zero) message be used for this purpose. Figure 1 shows the format:

<---32 bits--->	<---32 bits--->	<---16 bits--->	<-----?----->	
+-----+	+-----+	+-----+	+-----+	+
leader	marking	checksum	padding	
+-----+	+-----+	+-----+	+-----+	+
